

In the Specification:

Please replace the paragraph on page 4, commencing at line 12 with the following rewritten paragraph:

Furthermore, in the above-mentioned structure, the non-rectangular capacitor is desirably a ground earth capacitor, and a ground earth capacitor having a relatively large capacitance can be mounted within a space on the alumina substrate in high density by using the non-rectangular capacitor as the ground earth capacitor.

Please add the following paragraph on page 14 following line 9:

The non-rectangular shapes are comprised of a first rectangular shape to which a second rectangular shape is contiguously located to form a non-rectangular shape and which may be further extended by contiguously locating additional rectangular shapes thereto. Ground capacitors C2 and C7 are examples of this structure. The resultant non-rectangular shape is continuous, and the upper and lower capacitor plates thus formed are each continuously conductive.
